Project description

This library implements the well-behaved daemon specification of PEP 3143, "Standard daemon process library".

A well-behaved Unix daemon process is tricky to get right, but the required steps are much the same for every daemon program. A *DaemonContext* instance holds the behaviour and configured process environment for the program; use the instance as a context manager to enter a daemon state.

Simple example of usage:

```
import daemon

from spam import do_main_program

with daemon.DaemonContext():
    do_main_program()
```

Customisation of the steps to become a daemon is available by setting options on the *DaemonContext* instance; see the

using Google
BigQuery

documentation for that class for each option.
